Star DISPATCH

StarDispatch

From document to selective distribution

Operations for selective document dispatching are performed within the StarDispatch module.
It allows data streams to be split or regrouped for distribution by the most appropriate media such
as printer, electronic mail, fax or the Company's archive server.

Incoming data from different sources [files, data entry…] can be used with StarDispatch.
It is also possible to duplicate, filter or regroup information for ongoing automatic distribution
by the most appropriate program available.

When combined together, all these possibilities can be used to create large or small scale projects.
And this is easily achieved thanks to StarDispatch-Design's project modeling graphical interface
functioning under Windows.

StarDispatch interfaces directly with StarPage to generate paper, HTML, PDF or other documents.
It works in conjunction with StarEmail to generate electronic mail and with StarFind to archive
documents or make them available over the Web. Also, working in combination with any third party
user program, StarDispatch can perform the same vital data preparation functions even for
non-StarJet systems.

Main features

Graphical, Windows based interface
splits and/or regroups dataflow onto pages
sorts pages
duplicates pages
executes orders on outgoing data
splits output into documents with automatically numbered pages
generates groups of documents
Environmental management, enabling predefined actions on information flow as a function
of the operating platform

Interface and reference manual available in English and French.
StarDispatch functions under UNIX, Windows server or Windows workstation.
StarDispatch-Design functions under Windows 98, XP, 2000 or 2003.
